STREAMLINED PALLET HANDLING APPARATUS AND METHOD

Abstract

Methods and an apparatus are disclosed for handling pallets to be inspected and sorted. The method can include tipping a substantially vertically oriented pallet in a forward rotational direction to expose and allow inspection of a trailing major surface of the pallet. A lower portion of the pallet then can be moved to cause the pallet to tip in a rearward rotational direction and land in a substantially horizontal position. The apparatus can include a pallet restraining device for blocking the motion of an upper portion of the pallet as it tips in the forward rotational direction and a conveyor for moving the lower portion of the pallet to cause the pallet to tip in the rearward rotational direction.
